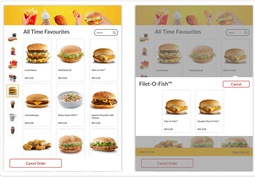
Use Design tool for user requirement collection and analysis of various interfaces such as kiosks
Visit minimum 5 interfaces. Identify problems in overall navigation, look and feel of the interface, relevance of the information. Record all findings using Design tool.

ATM Interface (State Bank of India / HDFC)

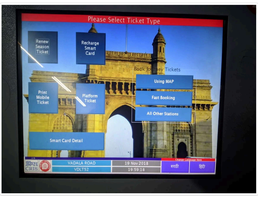
- Overall Navigation
- \+ Linear flow (Insert Card → Pin → Amount). Impossible to get "lost."
- \- "Cancel" button on the screen often conflicts with the physical keypad "Cancel" button.
- Look & Feel
- \+ High contrast (Blue/Yellow) makes it readable in sunlight.
- \- Old resistive touchscreens require hard pressing; buttons often look "Windows 95" style.
- Relevance of Information
- \+ Only shows options relevant to the specific card inserted.
- \- Often forces users to view "Marketing Offers" or "Language Selection" before the main task.
- User Pain Points
- The "Receipt Y/N" prompt appears at the end when the user just wants to leave.
- Keypad covers are often broken, making PIN entry feel insecure.

McDonald's Self-Ordering Kiosk



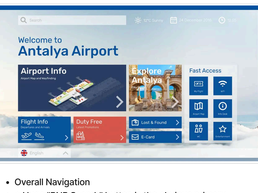
- Overall Navigation
- \+ Visual menu (Picture first, text second) bridges language barriers.
- \- "Customize Burger" flow is deep; hitting "Back" sometimes resets the whole order.
- Look & Feel
- \+ Beautiful, high-resolution food photography triggers appetite.
- \- Animations between screens are slow, frustrating users in a rush.
- Relevance of Information
- \+ Upselling ("Do you want fries?") is timed perfectly before payment.
- \- Calorie counts are often hidden or too small to read.
- User Pain Points
- The screen is physically very tall; short users or kids cannot reach the "Top Tabs" (Burgers/Drinks).
- Paper receipt often jams or doesn't print

3. Railway Ticket Vending Machine (ATVM)



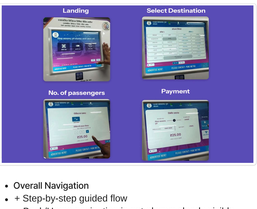
- Overall Navigation
- \+ Map-based selection (touch the destination on the map) is faster than typing.
- \- The "Smart Card" vs. "QR Code" payment selection is often confusingly labeled.
- Look & Feel
- \+ Interface is static with no complex animations (good for low-end hardware).
- \- Touch targets (station names) are often too small for "fat fingers," leading to wrong selections.
- Relevance of Information
- \+ Shows "Next Train" time for the selected destination.
- \- Displays "Return Ticket" options even when the last train has left.
- User Pain Points
- Screen calibration is often off (you press 'Dadar' and it selects 'Bandra').
- Glare from station lights makes the screen unreadable.

4. Airport Self Check-In Kiosk



- Overall Navigation
- \+ Huge "PNR Search" button is the obvious primary action.
- \- Seat selection map is often confusing (which side is the front of the plane?).
- Look & Feel
- \+ Clean white interface feels professional and hygienic.
- \- Scanning the passport/barcode is awkward; the laser placement is not intuitive.
- Relevance of Information
- \+ Clearly highlights "Gate Number" and "Boarding Time."
- \- Often asks "Do you have dangerous goods?" with a generic "Yes/No" that people skip without reading.
- User Pain Points
- Keyboard layout is usually ABCDE instead of QWERTY, slowing down typing.
- Printing the baggage tag requires awkward peeling and sticking instructions.

5. Metro Ticket Vending Machine



- Overall Navigation
- \+ Step-by-step guided flow
- – Back/Home navigation is not always clearly visible on every screen.
- Look & Feel
- \+ Clean and modern UI consistent with Maha Metro branding.
- – Screen glare due to lighting in open stations can reduce readability.
- Relevance of Information
- \+ Clearly displays fare and total amount before payment.
- – Error messages like "Transaction Failed" or "Invalid Input" are not descriptive.
- User Pain Points
- Users find it difficult to quickly locate their destination in long station lists.
- Touchscreen delay sometimes causes multiple taps or wrong selections.
